### REC\_DS using C\_Week 2\_COD\_Question 5

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### **Section 1 : Coding**

##### **1. Problem Statement**

Ashwin is tasked with developing a simple application to manage a list of items in a shop inventory using a doubly linked list. Each item in the inventory has a unique identification number. The application should allow users to perform the following operations:

Create a List of Items: Initialize the inventory with a given number of items. Each item will be assigned a unique number provided by the user and insert the elements at end of the list.

Delete an Item: Remove an item from the inventory at a specific position.

Display the Inventory: Show the list of items before and after deletion.

If the position provided for deletion is invalid (e.g., out of range), it should

display an error message.

### ***Input Format***

The first line contains an integer  $n$ , representing the number of items to be initially entered into the inventory.

The second line contains  $n$  integers, each representing the unique identification number of an item separated by spaces.

The third line contains an integer  $p$ , representing the position of the item to be deleted from the inventory.

### ***Output Format***

The first line of output prints "Data entered in the list:" followed by the data values of each node in the doubly linked list before deletion.

If  $p$  is an invalid position, the output prints "Invalid position. Try again."

If  $p$  is a valid position, the output prints "After deletion the new list:" followed by the data values of each node in the doubly linked list after deletion.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 4

1 2 3 4

5

Output: Data entered in the list:

node 1 : 1

node 2 : 2

node 3 : 3

node 4 : 4

Invalid position. Try again.

### ***Answer***

```
// You are using GCC
```

```
#include<stdio.h>
```

```
#include<stdlib.h>
```

```
struct node{
    int data;
    struct node* next;
    struct node* prev;
};
```

```
struct node* in(struct node* head,int data){
    struct node* newnode=(struct node*)malloc(sizeof(struct node));
    newnode->data=data;
    newnode->next=NULL;
    newnode->prev=NULL;
    if(head==NULL){
        return newnode;
    }
    struct node* temp=head;
    while(temp->next!=NULL){
        temp=temp->next;
    }
    temp->next=newnode;
    newnode->prev=temp;
    return head;
}
```

```
void dis(struct node* head){
    int i=0;

    struct node* temp=head;
    while(temp!=NULL){
        i++;
        printf(" node %d : %d\n",i,temp->data);
        temp=temp->next;
    }
}
```

```
}
```

```
void del(struct node** head,int pos){
    int max=0;

    struct node* temp= *head;
```

```

while(temp!=NULL){
    max++;
    temp=temp->next;
}

if(max<pos||pos<=0){

    return;
}

else{
    struct node* t2=NULL;
    temp=*head;
    pos=pos-2;
    while(pos--){
        temp=temp->next;
    }
    t2=temp->next;
    temp->next=temp->next->next;
    free(t2);
}
}

```

```

int main(){
    struct node* head=NULL;
    int a,b,pos;
    scanf("%d",&a);
    for(int i=0;i<a;i++){
        scanf("%d",&b);
        head=in(head,b);
    }
    printf("Data entered in the list:\n");
    dis(head);
    scanf("%d",&pos);
    if(pos>a){
        printf("Invalid position. Try again.");
    }
    else{

```

```
del(&head,pos);  
printf("\n\n");  
printf("After deletion the new list:\n");  
dis(head);}  
return 0;  
}
```

**Status :** Correct

**Marks : 10/10**
